Teil 0 · Worum es geht

So benutzt du dieses Handbuch

Dieses Handbuch baut die Online-Persona "AndrexTheDev" komplett auf: Profil, Markenstimme, Logo-Ideen, Landingpage, Bios für jede Plattform, fertige Artikel und Posts in mehreren Varianten, Hashtags, SEO, einen 30-Tage-Plan und Prompts für neue Inhalte. Alles ist auf kostenlose Werbung ausgelegt.

Sprache: Erklärungen sind auf Deutsch. Alles, was du veröffentlichst (Bios, Artikel, Posts, Prompts), ist auf Englisch – fertig zum Kopieren.

Quellen: GitHub (5 Repositories, 2 Live-Websites, Issues, READMEs), Google Drive (ca. 130 Dateien, AI-Studio-Applets) und Google Docs (über 20 Konzept-Dokumente). Deine Antworten: ungefähre Region zeigen (deutscher Entwickler in Spanien), Autodidakt/Indie-Hacker, bestehende Konten Substack und GitHub, Schwerpunkt auf Live-Projekten.

Wichtig 1: Bento.me wurde nach der Übernahme durch Linktree am 13.02.2026 abgeschaltet. Die Landingpage ist deshalb für kostenlose Alternativen im gleichen Grid-Stil geplant (Kapitel 4).

Wichtig 2 – ehrlich zum Thema "KI-Erkennung": Die Texte sind bewusst in einer natürlichen, persönlichen Stimme geschrieben, mit echten Details aus deinen Projekten. Das ist gutes Schreiben, kein Trick. Einige Plattformen haben eigene Regeln zu KI-Texten (z. B. Kennzeichnungspflicht oder Verbote für KI-Kommentare in Communitys wie Hacker News). Prüfe vor dem Posten die aktuellen Regeln. Der beste Schutz: Jeden Text vor dem Posten mit eigenen Worten, eigenen Erlebnissen und Tippfehler-Korrekturen in deinem Stil anpassen (Kapitel 9).

Wichtig 3: In den Texten stehen nur Fakten, die in deinen Konten belegt sind (z. B. 463/0 Release-Audit, 714 Tests, 12 Börsen). Erfinde keine Nutzerzahlen – Ehrlichkeit ist bei Entwickler-Communitys die stärkste Werbung.

Teil 1 · Das Persona-Profil

Kapitel 1 · Wer ist AndrexTheDev?

Kern-Identität (aus deinen Daten abgeleitet)

- Name/Pseudonym: AndrexTheDev
- Herkunft & Ort: deutscher Indie-Entwickler, lebt in Spanien (Costa Blanca/Madrid-Region – nur "Spain" nennen).
- Rolle: autodidaktischer Indie-Hacker, der mit KI-Werkzeugen (Cursor, Aider, DeepSeek, Gemini) in kurzer Zeit komplette Produkte baut und veröffentlicht.
- Tempo als Markenzeichen: GitHub-Konto seit 23.08.2026 – in sieben Wochen 5 Repositories, 2 Live-Produkte, eine DJ-App in Arbeit.
- Themen: Krypto-Tools & Charts, Datenschutz & clientseitige Apps, KI-Automatisierung, Musik/DJ, OSINT, Maker-Hardware (Nitinol-Motor, Peltier).
- Werte: kostenlos nutzbar, keine Anmeldung, Daten bleiben beim Nutzer, offen über Fortschritt und Fehler sprechen.

Positionierung in einem Satz

- EN: "Self-taught indie dev in Spain shipping free, no-signup tools for crypto traders and developers – fast, in public."

Taglines (zur Auswahl)

- "I ship tools, not promises."
- "Free tools. No signup. Shipped in public."
- "From idea to live URL in days."
- "Building in public from Spain – one tool at a time."

Die Geschichte (Origin Story) - Kernpunkte

- Kein klassischer Informatik-Weg: Ideen stapelten sich in Google Docs (Krypto-Gericht, Battle-Royale-Spiel, Audio-Restaurierung, Nitinol-Motor).
- August 2026: Entscheidung, nicht mehr nur zu planen, sondern zu veröffentlichen – GitHub-Konto angelegt, erstes Projekt NodeChart.
- KI als Werkzeug, nicht als Ersatz: Jede App wird getestet (463 Audit-Checks, 714 Tests), live gestellt und öffentlich dokumentiert.
- Ziel: ein Portfolio nützlicher, kostenloser Tools – finanziert über dezente Werbung und Spenden statt Abos.

Kapitel 2 · Markenstimme (Voice & Tone)

- Direkt und konkret: Zahlen, Befehle, Screenshots statt Superlative.
- Locker, ein bisschen trocken-humorvoll, selbstironisch über Bugs.
- Erste Person ("I built", "I broke", "I learned") – nie "we", du bist eine Person.
- Kurze Sätze gemischt mit längeren. Gelegentlich Satzfragmente. Wie man spricht.
- Verbotene Floskeln (klingen nach KI und Marketing): "game-changer", "revolutionize", "delve", "unlock the power", "in today's fast-paced world", "seamless", "elevate", "leverage", "tapestry", "embark on a journey".
- Deutsche Herkunft darf durchscheinen ("German precision, Spanish sunshine" einmalig in der Bio, nicht ständig).

Kapitel 3 · Visuelle Identität & Logo-Ideen

Farbpalette

- Charcoal #0E1116 (Hintergrund) · Mint #19E3A8 (Hauptfarbe) · Cyan #22D3EE (Verlauf) · Orange #FF8A3D (Akzent, sparsam) · Weiß #F5F7FA (Text)

Schriften (kostenlos, Google Fonts)

- JetBrains Mono oder Space Mono für Überschriften/Wortmarke, Inter für Fließtext.

Logo-Konzept 1 · "Candle A"

Zwei Kerzen eines Kurscharts bilden ein "A", darunter ein Terminal-Cursor. Verbindet Krypto-Charts (NodeChart) mit Entwicklung. Stärkstes Konzept für den Live-Projekt-Fokus. Ideal als Profilbild.

Logo-Konzept 2 · "Terminal Lambda"

App-Icon mit Prompt-Symbol und stilisiertem A im Mint-Cyan-Verlauf. Wirkt wie eine App – gut für Favicon, GitHub-Avatar und Substack.

Logo-Konzept 3 • "Node Hex"

Ein Hexagon aus Netzwerkknoten mit A im Inneren und orangem Akzentpunkt. Passt zu NodeChart und PuppetNET (Netzwerk-Graphen). Skaliert gut auch sehr klein.

Logo-Konzept 4 • Wortmarke

"AndrexThe" in Weiß, "Dev" in Mint, blinkender Block-Cursor. Für Banner, Artikel-Header, Video-Abspann.

Empfehlung

- Profilbild überall: Konzept 1 (Wiedererkennung ist wichtiger als Abwechslung – überall dasselbe Bild!).
- Banner: das Banner-Motiv oben plus Wortmarke links, Text "Free tools. No signup. Shipped in public."
- Logos kostenlos final zeichnen: Figma (Free), Inkscape oder Canva Free – als SVG exportieren.

Logo-Prompts (English, für weitere Varianten)

Minimal flat vector logo on a dark charcoal background: a bold geometric letter "A" formed by two upward candlestick chart bars, a small terminal cursor underscore below, mint green #19E3A8 and white, clean modern tech brand mark, centered, no text.

App icon logo: terminal prompt symbol ">_" merged with a stylized letter A inside a rounded square, mint-to-cyan gradient, flat vector, crisp edges, no text.

Geometric hexagon made of connected network nodes forming a subtle letter A, mint green nodes with one orange accent node, flat vector on dark background, no text.

Wordmark "AndrexTheDev" in a modern monospace font, white letters with "Dev" in mint green and a block cursor at the end, dark charcoal background, flat, perfectly legible spelling.

Teil 2 · Landingpage & Plattformen

Kapitel 4 · Die Landingpage (Bento-Stil, kostenlos)

Welche Plattform?

- Option A (empfohlen, 0 €, volle Kontrolle): eigene Seite auf Cloudflare Pages unter `andrexthedev.pages.dev` – du nutzt Cloudflare schon für NodeChart und GitBinder. Ich kann sie dir als nächsten Schritt bauen.
- Option B (schnell, 0 €): `tini.bio` oder `own.page` – Grid-Layouts wie Bento, Drag-and-Drop.
- Option C: Linktree Free – stabil, aber nur Listen-Layout.
- Später optional: eigene Domain `andrexthe.dev` oder `andrexthedev.com` (ca. 10–15 €/Jahr) – erst wenn Geld da ist.

Grid-Aufbau (Kacheln von oben links nach unten rechts)

- Kachel 1 (groß, 2×2): Profilbild, Name, Bio-Zeile, Standort "Spain".
- Kachel 2 (2×1): NodeChart mit Screenshot und Button "Open free charts".
- Kachel 3 (2×1): GitBinder mit PDF-Vorschau und Button "Turn your repos into a book".
- Kachel 4: GitHub · Kachel 5: Substack (Newsletter-Anmeldefeld) · Kachel 6: X · Kachel 7: Bluesky
- Kachel 8: "Building now" – ChampionVibe (DJ app, coming soon) mit Warteliste über Substack.
- Kachel 9: GlobeOrFlat & PuppetNET ("Labs").
- Kachel 10: Medium · dev.to · Hacker News · Reddit · Kachel 11: "Support my work" – Krypto-Spendenadressen + Ko-fi (kostenlos).

Texte für die Landingpage (English)

Headline: AndrexTheDev

Subline: Self-taught indie dev in Spain. I build free, no-signup tools for crypto traders and developers – and I ship them in public.

NodeChart tile: Real-time crypto charts from 12 exchanges, whale alerts and token safety checks. Free, no account. → nodechart.cc

GitBinder tile: Turn your GitHub projects into a clean PDF portfolio – right in your browser. Nothing leaves your machine. → gitbinder.pages.dev

Building now: ChampionVibe – a DJ app for Windows and Android with stem separation and beat grids. Get notified on Substack.

Newsletter tile: One email when I ship something. Build logs, mistakes, numbers. No spam, ever.

Support tile: Everything I make is free. If a tool saved you time, a coffee or a few sats keep the servers running.

SEO für die Landingpage

- Title-Tag: "AndrexTheDev – Free Crypto & Developer Tools | NodeChart, GitBinder"
- Meta-Description (max. 155 Zeichen): "Indie dev from Spain building free, no-signup tools: NodeChart crypto charts and GitBinder PDF portfolios. Build logs and new launches."
- Überall den gleichen Namen und Link verwenden (Konsistenz = Google erkennt die Persona als Entität).

Kapitel 5 · Plattformen, Bios & Einrichtung

Grundregeln für alle Profile

- Handle überall gleich: @AndrexTheDev (falls vergeben: @andrexdev, @andrex_dev).
- Gleiches Profilbild, gleiche Farben, Link immer auf die Landingpage.
- Erst Profil komplett ausfüllen, dann 3-5 Beiträge posten, dann erst Werbung machen.

Bio – Kurzform (bis 160 Zeichen, X/Bluesky/Threads)

Variante 1: Self-taught indie dev in Spain [ES-flag emoji] Shipping free, no-signup tools for crypto & devs. NodeChart • GitBinder • building a DJ app. Build logs ↓

Variante 2: I build free tools nobody asked me to build. Then people use them. Crypto charts, PDF portfolios, DJ software. German dev, Spanish sun.

Variante 3 (Krypto-Publikum): Free real-time charts from 12 exchanges + whale alerts → nodechart.cc | Indie dev, no VC, no signup walls.

Variante 4 (Dev-Publikum): Indie hacker | TypeScript, Next.js, Rust/Tauri, Flutter, Cloudflare | 5 repos in 7 weeks | Shipping in public.

Bio – Mittel (GitHub, Hacker News, Reddit, dev.to)

Self-taught developer from Germany, living in Spain. I build small, useful tools and put them online for free: NodeChart (real-time crypto charts, nodechart.cc) and GitBinder (GitHub repos to PDF, gitbinder.pages.dev). Currently working on ChampionVibe, a DJ app in Rust/Tauri. I write about what works, what breaks and what it costs.

Bio - Lang (Medium, Substack "About", LinkedIn)

Hi, I'm Andrex. I'm a self-taught developer from Germany, living in Spain.

For years my ideas lived in notes: a satirical court for crypto drama, a battle-royale game, an audio restoration app, even a motor that runs on hot water. In August 2026 I stopped collecting ideas and started shipping them.

Seven weeks later I had five repositories and two live products. NodeChart gives traders free real-time charts from 12 exchanges, whale alerts and token safety checks – no account needed. GitBinder turns your GitHub projects into a clean PDF portfolio, entirely in your browser.

I use AI coding tools a lot, and I'm open about it. But tools don't ship products – testing does. NodeChart passed 463 release checks before v1.0. GitBinder runs 714 automated tests.

Here I write build logs: the stack, the bugs, the costs (mostly zero), and what I learn along the way. Right now I'm building ChampionVibe, a DJ app for Windows and Android. Subscribe if you want to watch it come together.

GitHub-Profil-README (Repository "AndrexTheDev/AndrexTheDev")

Hi, I'm Andrex [wave emoji]

Self-taught indie dev from Germany, based in Spain. I ship free, no-signup tools.

Live

- **NodeChart** – real-time crypto charts from 12 exchanges, whale stream, token safety checks → <https://nodechart.cc>

- **GitBinder** – turn your GitHub repos into a PDF portfolio, 100% client-side → <https://gitbinder.pages.dev>

Building

- **ChampionVibe** – DJ app (Tauri v2 + Rust) with stem separation, beat grids, offline licensing

- **GlobeOrFlat** – measure Earth's curvature with your phone's sensors (Flutter)

- **PuppetNET** – OSINT network graphs with spaCy + Neo4j

Stack

TypeScript · Next.js · Vite · Tailwind · Rust · Tauri · Flutter · Python · Cloudflare Workers/Pages/D1/R2

[mailbox emoji] Build logs: [Substack link] · [bird emoji] X: @AndrexTheDev

Plattform-Steckbriefe (alle kostenlos)

- Substack (vorhanden): Heimatbasis. Newsletter "Shipped in Public". 1 Ausgabe pro Woche. Die E-Mail-Liste gehört dir – wichtigster Kanal langfristig.
- X (Twitter): Reichweite durch Antworten unter großen Accounts (Krypto + #buildinpublic). Täglich 1 Post + 10 gute Antworten.
- Bluesky: Dev- und Tech-Community, weniger Lärm. Starter-Packs für Indie-Hacker beitreten.
- Medium: Lange Artikel; in Publikationen wie "Level Up Coding", "JavaScript in Plain English", "Coinmonks" einreichen (mehr Reichweite).
- dev.to & Hashnode: Kostenlose Dev-Blogs mit eingebauter Reichweite. Artikel von Medium mit Canonical-Link spiegeln.
- Hacker News: "Show HN" – einmal pro Projekt, gut getimt (Di-Do, 15–17 Uhr spanische Zeit). Nur das Produkt zeigen, ehrlich bleiben, alle Kommentare selbst beantworten.
- Reddit: r/SideProject, r/webdev, r/InternetIsBeautiful (GitBinder), r/CryptoCurrency, r/CryptoMarkets, r/BitcoinBeginners, r/opensource, r/flutterdev, r/rust. Vorher Regeln lesen, 90 % normal mitdiskutieren, 10 % eigene Links.
- Indie Hackers: Produkt-Seiten anlegen, Meilensteine posten.
- Product Hunt: Launch für NodeChart und GitBinder (kostenlos, Dienstag–Donnerstag, 09:01 Uhr Pazifikzeit = 18:01 Uhr Spanien).
- Telegram & Farcaster: Krypto-Publikum; eigener Telegram-Kanal "NodeChart Alerts".
- Mastodon (fosstodon.org): Open-Source-Fans, ideal für GitBinder und PuppetNET.
- LinkedIn: optional, für seriöse Wirkung; gleiche Long-Bio.
- YouTube Shorts / TikTok: 20-Sekunden-Bildschirmaufnahmen ("watch whales move in real time").
- Verzeichnisse (kostenlos eintragen, bringt Backlinks): AlternativeTo, SaaSHub, Uneed, Microlaunch, Fazier, BetaList, There's An AI For That (nur KI-Tools), awesome-Listen auf GitHub (z. B. awesome-crypto, awesome-pdf).

Keywords (SEO)

- Haupt-Keyword: "free crypto charts" · Neben-Keywords: "real-time crypto chart no signup", "whale alerts free", "TradingView alternative free", "token rug check", "Binance chart"
- Long-Tail: "free crypto charting tool without account", "track whale transactions in real time free"

Hashtags

- X/Bluesky: #crypto #bitcoin #trading #cryptotrading #buildinpublic #indiehackers #webdev
- Instagram/TikTok: #cryptocharts #bitcointrading #daytrading #altcoins #whalealert #cryptotools
- Regel: auf X max. 1–2 Hashtags pro Post, auf Instagram/TikTok 5–10.

Medium/Substack-Artikel – Lang (Entwickler-Publikum)

Title: I Built a Free Crypto Charting App in 3 Weeks. Here's the Stack, the Mistakes and the 463-Check Audit

Subtitle: Next.js 16 on Cloudflare, 12 exchange WebSockets and zero servers to babysit.

I didn't plan to build a charting app. I was annoyed. Every time I wanted a quick look at a coin, I hit a login wall, a cookie banner the size of my screen, or a "Pro" badge on the one indicator I needed. So on August 23, 2026, I opened a fresh GitHub account and started NodeChart.

The rule was simple: no signup, no paywall, fast. Three weeks later it was live at `nodechart.cc`.

The stack. Next.js 16, deployed to Cloudflare through OpenNext. I picked Cloudflare because the free tier is generous and I didn't want to wake up to a server bill. State lives in Zustand, styling is Tailwind with a dark, slightly cyberpunk theme, and the UI speaks five languages through next-intl.

The hard part: 12 exchanges. Every exchange has its own WebSocket format. Some send full order books, some send diffs, one sends timestamps in seconds while the rest use milliseconds (that one cost me an evening). I ended up writing one small adapter per exchange that normalizes everything into the same candle format. Adding a 13th exchange now takes about an hour.

DEX tokens and rug checks. For tokens that only trade on decentralized exchanges I pull data from DexScreener and GeckoTerminal. Before showing a new token, NodeChart asks GoPlus and RugCheck whether the contract looks dangerous: honeypot, mintable supply, owner can pause trading. It's not financial advice, but it has already saved me from one obvious scam.

The whale stream. Big transactions show up live, and there's a /terminal view for people who prefer a dense, keyboard-first screen.

What I got wrong. I shipped too many features before testing them properly. So before tagging v1.0.0 I wrote a release audit: 463 checks across routes, locales, adapters and edge cases. First run: dozens of failures. Final run on September 14: 463 passed, 0 failed. Writing the checklist was boring. It was also the most useful day of the project.

Money. The app is free and paid for by a few non-intrusive ads. No accounts means no user data to protect or leak, which is a feature in itself.

What's next: alerts by Telegram, more indicators, and a public changelog. If you trade or just like watching markets move, try it at nodechart.cc and tell me what's broken. I read every message.

Artikel - Lang (Krypto-Trader-Publikum)

Title: The Free Crypto Chart I Wish I Had When I Started Trading

Most charting tools want three things before you see a single candle: your email, your money, or your patience. I got tired of all three, so I built NodeChart – a free charting site you can open and use in two seconds.

What you get: live prices from 12 major exchanges in one place, so you can compare where a coin is actually moving. A whale stream that shows large transactions as they happen. And a safety check for new tokens: before you ape into something on a DEX, NodeChart runs it through GoPlus and RugCheck and shows red flags like honeypot contracts or unlimited minting.

What you don't get: a signup form, a subscription, or a newsletter popup.

Three ways I use it every day. First, I check if a pump is real by comparing volume across exchanges. Second, I keep the whale stream open on a second screen. Third, I paste every new token address into the safety check before buying. It takes ten seconds and has saved me money more than once.

It's at nodechart.cc. It's free. Not financial advice, obviously – but a better view of the market never hurts.

Artikel - Kurz (für Einsteiger/allgemein)

Title: Watch Crypto Whales Move in Real Time – Free, No Account

Ever wondered why a coin suddenly jumps 10%? Often it's a "whale" – someone moving huge amounts. NodeChart shows those big trades live, plus easy-to-read price charts from 12 exchanges. It also warns you when a new token looks like a scam. Open `nodechart.cc`, pick a coin, done. No signup, no cost.

Show HN

Title: Show HN: NodeChart – free real-time crypto charts from 12 exchanges, no signup

Text: Hi HN, I'm a self-taught dev in Spain. NodeChart is a charting site I built because I was tired of login walls. It's Next.js 16 on Cloudflare via OpenNext, with a small adapter per exchange that normalizes 12 different WebSocket formats into one candle stream. It also pulls DEX data (DexScreener, GeckoTerminal) and runs token safety checks via GoPlus/RugCheck. There are no accounts, so there's no user data. Before 1.0 I wrote a 463-item release audit, which was the most useful thing I did. Happy to answer questions about the adapters or the Cloudflare setup – and I'd love to hear what breaks.

Reddit

r/SideProject – Title: I got tired of login walls on crypto charts, so I built a free one (12 exchanges, no account)

Body: Three weeks of evenings, a lot of WebSocket debugging, and it's live: `nodechart.cc`. Live charts from 12 exchanges, a whale transaction stream, and rug checks for new DEX tokens. No signup, free (a few ads pay for hosting). Stack: Next.js 16 + Cloudflare. I'm looking for honest feedback, especially on mobile. What would make you actually use it?

r/CryptoCurrency (Regeln prüfen, oft nur im Daily Thread erlaubt) – Title: Free tool: check a new token for honeypot/mint red flags before buying

Body: I built a free charting site that also runs new tokens through GoPlus and RugCheck before showing the chart. Not advice, just a quick safety net. No account needed. Feedback welcome.

X - Thread (Lang)

1/ I spent 3 weeks building a free crypto chart app because every other one wanted my email first. It's live. Here's what I learned [thread emoji]

2/ 12 exchanges = 12 different WebSocket formats. One of them sends timestamps in seconds. Everyone else uses milliseconds. Guess how I found out.

3/ Fix: one tiny adapter per exchange → same candle format for all. Adding a new exchange now takes about an hour.

4/ New DEX tokens get checked with GoPlus + RugCheck before you see the chart. Honeypot? Mintable? You'll know.

5/ Before v1.0 I wrote a 463-item release audit. First run: lots of red. Final run: 463/0. Boring day. Best day.

6/ No accounts = no user data = nothing to leak. Free, paid for by a few ads.

7/ Try it, break it, tell me: nodechart.cc

X - Kurzposts (einzeln, verteilt über Wochen)

Built a crypto chart site with zero signup. You open it, you see candles. That's the whole onboarding. nodechart.cc

Whale just moved \$40M? You'll see it live on nodechart.cc. Free. (Hinweis: nur posten, wenn du einen echten Screenshot dazu hast)

Before you buy that new token: paste the address. Honeypot, mint, pause – red flags in 10 seconds. Free on nodechart.cc

One exchange sends timestamps in seconds. The other 11 use milliseconds. This is my villain origin story. [#buildinpublic](https://twitter.com/buildinpublic)

Bluesky / Mastodon

Shipped: NodeChart, free real-time crypto charts from 12 exchanges. Next.js 16 on Cloudflare, one adapter per exchange, no accounts, no tracking of users. Feedback very welcome → nodechart.cc

Product Hunt

Tagline (60 Zeichen): Free real-time crypto charts. No signup. 12 exchanges.

Description: NodeChart puts live charts from 12 exchanges, a whale transaction stream and token safety checks in one fast, free web app. No account, no paywall, five languages.

Maker comment: Hey hunters! I'm Andrex, a self-taught dev in Spain. I built NodeChart because I wanted to look at a chart without creating an account first. It's free and always will be at its core. I'd love your honest feedback – what's missing for you?

Video-Skript (20 Sek., TikTok/Shorts)

Hook (0–3 s): "This is what a crypto whale looks like in real time." Show whale stream.
(3–12 s): "Free charts from 12 exchanges, no account." Switch coins quickly. (12–18 s):
"And it checks new tokens for scams." Paste address, red flags appear. (18–20 s):
"nodechart.cc – link in bio."

Artikel – Lang (Entwickler)

Title: Your GitHub Is Your CV. So I Built a Tool That Turns It Into a Book

Subtitle: 100% client-side, 714 tests, and one evening fighting PDF page breaks.

Recruiters don't click through 30 repositories. Clients don't either. When I wanted to show my projects to someone, I had a GitHub link and a lot of hope. So I built GitBinder: you enter your GitHub username, pick your repos, and it composes a clean PDF portfolio with a cover, a table of contents and one chapter per project.

The one rule: nothing leaves your browser. There's no backend. GitBinder talks to the public GitHub API directly from your machine, renders a live A4 preview, and builds the PDF locally. It runs on Cloudflare Pages for free and it's built with Vite and Tailwind v4.

PDF layout is harder than it looks. Long READMEs, code blocks that refuse to wrap, images in weird sizes, headings that end up alone at the bottom of a page. The "Classic Book" layout went through more iterations than I want to admit.

Testing. I wrote 714 tests across 35 suites. Then I did a full beta run: 16 modules, 70 screenshot captures, all green. If you've ever shipped something without tests, you know why I bothered.

It's free, in English and German, and it's at gitbinder.pages.dev. Try it with your own profile and send me the ugliest PDF it produces. I want to fix it.

Artikel – Kurz (Jobsuchende/Studierende)

Title: Turn Your GitHub Into a PDF Portfolio in 60 Seconds

Applying for a dev job? Attach your projects as a polished PDF instead of a bare link. GitBinder does it for free: enter your username, pick repos, download. Everything happens in your browser – your data never touches a server. gitbinder.pages.dev

Show HN

Title: Show HN: GitBinder – turn your GitHub repos into a PDF book, entirely client-side

Text: I built this to send a portfolio that's nicer than a profile link. It calls the GitHub API from the browser, shows a live A4 preview and generates the PDF locally – no backend, nothing stored. Vite + Tailwind v4 on Cloudflare Pages, 714 tests. The hardest part was page breaking for long READMEs and code blocks. Feedback on the layout is very welcome.

Reddit

r/webdev / r/SideProject – Title: I made a free tool that turns your GitHub repos into a PDF portfolio (runs entirely in your browser)

Body: Enter your username, choose repos, get a book-style PDF with cover and table of contents. No signup, no server, nothing stored. Would love feedback, especially from people who hire devs – what should a portfolio PDF show?

r/cscareerquestions (nur wenn erlaubt, als Frage formulieren): Do recruiters actually look at portfolio PDFs? I built a tool that makes one from GitHub and I'm wondering if it's worth improving.

X - Thread

1/ Recruiters don't click through 30 repos. So I built a tool that turns your GitHub into a PDF book. Free, nothing leaves your browser [thread emoji]

2/ Cover, table of contents, one chapter per project, live A4 preview.

3/ No backend at all. GitHub API → your browser → your PDF.

4/ 714 tests. 70/70 screenshot captures in beta. PDF page breaks still haunt my dreams.

5/ gitbinder.pages.dev – send me the ugliest PDF it makes, I'll fix it.

X - Kurzposts

Your GitHub, but as a book. With a table of contents. Free → gitbinder.pages.dev

Job hunting tip: attach a PDF of your projects, not just a link. I built a free tool for exactly that.

Zero servers. Zero data stored. One very nice PDF. #webdev

Product Hunt

Tagline: Turn your GitHub projects into a beautiful PDF portfolio

Description: GitBinder composes your repositories into a book-style PDF with cover, table of contents and live A4 preview. 100% in your browser, free, EN/DE.

Substack Ausgabe #1 (Vorstellung)

Title: Seven weeks, five repos, two live products: hello from Spain

Hi, I'm Andrex. Quick version: I'm a German self-taught developer living in Spain, and for a long time I was much better at having ideas than finishing them. My Google Docs are a graveyard of plans – a satirical AI court for crypto drama, a Hunger Games-style battle royale, a motor that runs on warm water.

In August I changed one rule: nothing counts until it has a URL. Since then I've shipped NodeChart (free crypto charts, nodechart.cc) and GitBinder (GitHub to PDF, gitbinder.pages.dev), and started three more projects.

This newsletter is the honest log. Every week: what I shipped, what broke, what it cost (usually nothing – I'm broke, so everything runs on free tiers), and the tools I use. Next issue: how I host two web apps for €0 a month.

If that sounds fun, stick around. Reply anytime – I answer every email.

Substack/Medium - Evergreen-Ideen (je 1 Artikel pro Woche)

How I host two production web apps for €0 a month (Cloudflare Pages, Workers, D1, R2)

AI coding tools didn't make me a developer. Tests did.

12 exchanges, 12 WebSocket formats: a practical guide to normalizing crypto data

Building a DJ app in Rust and Tauri as a self-taught dev (ChampionVibe build log)

Can your phone prove the Earth is round? Building GlobeOrFlat with sensor fusion

Mapping hidden networks in the news with spaCy and Neo4j (PuppetNET)

My idea graveyard: 8 projects I planned and never shipped – and what I learned

I tried to build a motor that runs on hot water (Nitinol, explained simply)

GlobeOrFlat - Teaser

X: Can your phone prove the Earth is curved? Building an app that measures it with sensor fusion – horizon dip, water sightlines, and a 2,200-year-old Eratosthenes trick. Flat or round, the data decides.

Reddit r/flutterdev: Building a Flutter app with EKF sensor fusion and Keystore-signed measurements – looking for advice on sensor accuracy across Android devices.

PuppetNET - Teaser

X: Working on an OSINT side project: spaCy pulls names from public news, Neo4j connects them, betweenness centrality flags the weird hubs. Graphs are addictive.

ChampionVibe - Teaser (Warteliste)

X: I'm building a DJ app in Rust. Stem separation, beat grids, reggae voice drops, and it runs on Windows and Android. Want early access? Join the list on my Substack.

Hashtags - Persona/Allgemein

- #buildinpublic #indiehackers #indiedev #solodev #100DaysOfCode #webdev #opensource #rustlang #flutter #cloudflare

Teil 6 · Schreiben wie ein Mensch, SEO & Tricks

Kapitel 9 · Natürlich schreiben (statt "KI-Klang")

- Echte Details schlagen alles: Datum, Fehler, Zahlen, "das hat mich einen Abend gekostet". KI-Texte sind generisch – deine sind es nicht.
- Satzlängen mischen: kurz. Dann ein längerer Satz, der etwas erklärt und ein bisschen abschweift. Dann wieder kurz.
- Keine Dreier-Aufzählungen in jedem Satz, keine Zusammenfassung am Ende ("In conclusion...").
- Floskel-Liste aus Kapitel 2 streichen, auch "Moreover", "Furthermore", "It's worth noting".
- Meinung zeigen: "I hate cookie banners." Menschen haben Meinungen.
- Eigene Fotos und Screenshots statt Stockbildern.
- Vor dem Posten laut lesen. Was du so nie sagen würdest, umschreiben.
- Jeden Text vor dem Posten um 1–2 persönliche Sätze ergänzen, die nur du kennst.
- Gleiche Texte nicht 1:1 auf mehreren Plattformen posten – Einleitung und Titel jeweils ändern.
- Plattformregeln respektieren: Hacker News will echte Menschen in Kommentaren – Antworten dort immer selbst schreiben.

Kapitel 10 · SEO-Grundlagen für jeden Artikel

- Haupt-Keyword in Titel, erstem Absatz, einer Zwischenüberschrift und der URL/Slug.
- Titel 50–60 Zeichen, Meta-Beschreibung 140–155 Zeichen.
- Zwischenüberschriften (H2/H3) alle 200–300 Wörter.
- Interne Links: jeder Artikel verlinkt Landingpage + ein Projekt; externe Links zu Quellen (Cloudflare-Docs, GitHub).
- Canonical-URL: Original auf Substack oder Medium, Kopien auf dev.to/Hashnode mit "canonical_url" auf das Original (sonst Duplicate Content).
- Bilder mit Alt-Text ("NodeChart real-time Bitcoin chart with whale stream").
- Projekt-Websites: Open-Graph-Bilder, sitemap.xml, schnelle Ladezeit, in der Google Search Console (kostenlos) anmelden.
- GitHub-Repos: Topics setzen (crypto, charting, nextjs, cloudflare, pdf, portfolio ...), Beschreibung mit Keyword, Website-Link eintragen, Screenshots im README.

Kapitel 11 · Kostenlose Wachstums-Tricks

- Reply-Strategie auf X: Benachrichtigungen für 20 große Accounts (Krypto + Indie-Hacker) aktivieren und in den ersten 10 Minuten eine kluge, eigenständige Antwort schreiben – kein Link, nur Mehrwert. Profil-Besuche kommen von selbst.
- Bluesky: Starter-Packs "indie hackers", "web developers" folgen; eigenes Starter-Pack "Free crypto tools" erstellen.
- Wöchentliche Threads auf Reddit nutzen ("Show-off Saturday" r/webdev, "What are you working on" Threads).
- Hacker News: Nur ein "Show HN" pro Projekt, bei Misserfolg nach einigen Wochen mit großem Update erneut.
- Product Hunt: Unterstützer vorher informieren (Substack, X), aber nicht um Upvotes betteln – das ist verboten.
- awesome-Listen auf GitHub: per Pull Request eintragen lassen (dauerhafte Backlinks und Besucher).
- Kooperation: andere Indie-Devs gegenseitig im Newsletter vorstellen.
- Content-Recycling: 1 langer Artikel → 1 Thread → 5 Kurzposts → 1 Video → 1 Reddit-Post.
- Telegram-Kanal mit automatischen Whale-Alerts aus NodeChart als Wachstumsmotor (Server läuft bereits auf Hetzner/Cloudflare Free).
- Spendenlink überall: Ko-fi (kostenlos) und Krypto-Adressen.

Kapitel 12 · 30-Tage-Plan

- Tag 1-2: Handles sichern (X, Bluesky, Medium, dev.to, Hashnode, Reddit, HN, Product Hunt, Indie Hackers, Mastodon, Telegram). Profilbild Logo 1, Banner, Bios.
- Tag 3: Landingpage live, GitHub-Profil-README, Repo-Topics, Substack "About" aktualisieren.
- Tag 4-7: Substack #1, täglich X-Antworten, je 1 Kurzpost, 3 Reddit-Kommentare ohne Link.
- Woche 2: NodeChart-Artikel (Medium + dev.to), X-Thread, Reddit r/SideProject, Bluesky-Post, Video.
- Woche 3: Show HN NodeChart (Di/Mi), GitBinder-Artikel, Einträge in Verzeichnissen.
- Woche 4: Product Hunt GitBinder, Show HN GitBinder, Substack-Ausgabe "€0 hosting", ChampionVibe-Warteliste.
- Danach: 1 langer Artikel/Woche, 1 Post/Tag, monatlicher "Build Report".

Kapitel 13 · Kennzahlen (kostenlos messen)

- Besucher: Cloudflare Web Analytics (gratis, ohne Cookies).
- Newsletter-Abos (Substack-Dashboard) – wichtigste Zahl.
- Profil-Besuche und Follower pro Woche, Klicks auf Landingpage-Links.
- Jeden Sonntag 15 Minuten: Was hat funktioniert? Mehr davon.

Anhang · Prompts (English)

Prompts zum Erstellen neuer Inhalte in deiner Stimme

P1 · Voice Prompt (immer zuerst einfügen)

You are writing as AndrexTheDev, a self-taught indie developer from Germany living in Spain. Voice: first person, direct, concrete, dry humor, self-deprecating about bugs. Mix short and long sentences, use occasional fragments. Use real numbers and specific details only from the facts I provide – never invent statistics, users or revenue. Never use these words: game-changer, revolutionize, delve, unlock, seamless, elevate, leverage, tapestry, journey, moreover, furthermore, in conclusion, in today's fast-paced world. No summary paragraph at the end. No emojis unless I ask.

P2 · Artikel aus Commit-Historie

Here is my commit log and README for [project]. Write a 900-word build-log article for Medium aimed at [developers / crypto traders / beginners]. Structure: a personal hook about the problem, the stack, one concrete bug story, what I'd do differently, a soft call to action with the link. Primary keyword: [keyword] – use it in the title, first paragraph and one subheading. Give me 5 title options, a 150-character meta description and 5 tags.

P3 · Ein Artikel → viele Formate

Turn this article into: one X thread (6–8 posts, under 270 characters each, no hashtags except the last post), five standalone X posts with different angles (humor, number, question, tip, behind the scenes), one Bluesky post, one LinkedIn post (150 words), one Reddit post for [subreddit] following its rules (no marketing tone, ask for feedback), and a 20-second video script with a 3-second hook.

P4 · Antworten auf X

Here is a tweet from [account]: "[text]". Write three possible replies as AndrexTheDev that add a genuine insight or experience from building crypto or developer tools. No links, no self-promotion, under 200 characters each, sounding like a quick reply typed on a phone.

P5 · Show HN

Write a Show HN title (under 80 characters, starting with "Show HN:") and a 120-word first comment for [project]. Plain, technical, humble. Explain what it is, why I built it, the interesting technical part and what feedback I want. No marketing adjectives.

P6 · Natürlicher überarbeiten

Edit this text so it reads like a real person wrote it quickly but carefully: vary sentence length, remove clichés and filler transitions, replace generic claims with the specific details already in the text, keep my facts unchanged, and keep my voice. Show the edited version only.

P7 · Wöchentlicher Newsletter

Write this week's "Shipped in Public" newsletter from these notes: [bullet notes]. Sections: What I shipped, What broke, What it cost, One thing I learned, What's next. 400–600 words, warm and honest, ending with a question readers can reply to.

P8 · SEO-Check

Act as an SEO editor. For this article and the keyword [keyword], check title length, meta description, keyword placement, headings, internal and external links, image alt texts and readability. Return a short list of concrete fixes, then the corrected title and meta description.

Checkliste

- Logo wählen (Empfehlung: Konzept 1) und als SVG final zeichnen.
- Handles auf allen Plattformen sichern, überall gleiches Bild und gleicher Link.
- Landingpage (Cloudflare Pages oder tini.bio) mit allen Links.
- Bios einfügen (Kurz/Mittel/Lang passend zur Plattform).
- GitHub: Profil-README, Topics, Website-Links, Screenshots.
- Substack: About-Seite, Ausgabe #1, Warteliste ChampionVibe.
- Inhalte nach 30-Tage-Plan posten, jeden Text vorher persönlich anpassen.
- Cloudflare Web Analytics und Google Search Console einrichten.
- Spendenlinks (Ko-fi + Krypto) überall.
- Jeden Sonntag auswerten.
